

PATIENCE AI

Fabric OS

A public guide to a Linux-compatible foundation for AI-assisted work.

PUBLIC RELEASE GUIDE

Product basics, device validation, security, privacy, and open-source use.

Version 0.1.0 | 10 September 2026

Prepared for evaluation and early device testing. This guide intentionally stays at the public product level.

A calmer operating system

Fabric OS is a Linux-compatible, local-first foundation for intelligent work. It is built around a simple idea: AI can help, while people keep the final say.

The public promise

The product is designed to keep intent clear, access limited, and important work understandable. It is an early research release, not a claim of universal hardware support or production certification.

AI helps. People decide.

What makes it different

Traditional software	Fabric OS public model
Actions can be opaque	Intent and outcome stay visible
Permissions are often broad	Access is meant to be limited
Failures can be hard to unwind	Important work is designed for review and recovery

Simple on the surface

The public flow is intentionally easy to explain: a person sets an intent, reviews the next step, and decides what happens.

Step	Public experience	What it means
01	Say what you need	Start with a goal in your own words.
02	See the next step	Fabric OS presents a clear, bounded suggestion.
03	Stay in control	You can accept, change, or stop before important work begins.
04	Keep the result	Important changes remain reviewable and recoverable.

PUBLIC BOUNDARY

The guide explains the experience, not private implementation or business logic.

Built for real machines

Fabric OS follows upstream Linux wherever practical and keeps the base system useful without cloud AI. The first target is x86_64 with UEFI and a GNU/Linux-compatible userspace.

Area	Public release position
Architecture	x86_64 initial target; additional architectures require separate validation.
Boot	UEFI device testing is required before claiming hardware support.
Userspace	GNU/Linux-compatible userspace with system services and a familiar shell.
AI	Local-first; cloud providers are optional and must be user-controlled.
Storage	ext4 research image for the current early build; installer and recovery status must be stated per release.

Device validation

Use a spare machine or a separately replaceable test disk. Record the exact model, firmware, CPU, memory, graphics, storage, network, audio, sleep, and recovery results. Do not install an early research image on your only computer.

See the public device guide at [/device](#) and the repository validation record before testing.

Useful, with clear limits

Fabric OS treats AI output as untrusted and keeps authority separate from suggestions. The public security posture is about boundaries, not about asking people to trust a model.

Principle	Public meaning
Fail closed	When a sensitive decision is unclear, access should stop.
Least privilege	A task should receive only the access it needs.
Local-first	Private work should be able to stay on the device.
Credential protection	Provider keys belong in secure storage, not ordinary settings or logs.
Recovery	Important changes should be reviewable and, where possible, reversible.

Privacy basics

The website uses necessary preference storage and optional analytics only after a visitor chooses it. The OS must apply the same public principles: clear notice, purpose-specific choices, easy withdrawal, minimal collection, retention limits, and a clear local/cloud indicator.

LEGAL STATUS

This guide is not a GDPR or DPDP certification and requires jurisdiction-specific review.

Use it responsibly

Fabric OS project code is intended to be distributed under the Apache License 2.0 unless a file or dependency says otherwise. Keep the license and notices with redistributed portions.

What the project license covers

The project license governs project code and documentation where the repository states that license. It does not automatically relicense the Linux kernel, firmware, model weights, datasets, fonts, icons, or third-party packages.

Asset type	Required release treatment
Fabric OS code	Apache License 2.0 notice and conditions.
Rust and Node dependencies	Keep each dependency's own license and attribution; archive a complete SBOM.
Linux and system components	Follow each upstream component's license and source/notice requirements.
Firmware and drivers	Record source, version, redistribution terms, and device limitations.
Models and datasets	Record exact version/hash, source, license, use restrictions, and provenance.
Fonts, icons, and media	Record origin and permission; do not assume the project license covers them.

Release rule

If the terms or provenance are unclear, keep the asset out of the release until reviewed.

Evidence before confidence

A launch candidate is more than a website and an image. Each release needs a named owner, a reproducible record, and evidence for the exact artifacts and devices being supported.

Gate	Evidence
Source	Reviewed tag, lockfiles, tests, and clean release record.
Artifacts	SHA-256 manifest, signatures, provenance, and SBOM.
Device	Exact hardware matrix, install results, recovery path, and known limitations.
Security	Threat tests, credential-redaction checks, incident process, and external review.
Privacy	Data map, retention, vendors, consent, rights process, and transfer review.
Support	Contact, vulnerability reporting, release notes, and end-of-life policy.

Support contact

Patience AI: info@patienceai.in

The contact and legal entity details must be finalized before production launch.

CURRENT STATUS

Fabric OS remains an early research release; do not use it as the sole system for safety-critical work.

Read this before publishing

This is a public product guide. It covers the user-facing product, supported release principles, privacy expectations, and open-source responsibilities.

Before launch

Finalize the legal entity, launch countries, governing law, privacy contact, terms of use, accessibility review, release process, support contact, and independent security review.

This guide is informational and is not a legal certification. Compliance depends on the organization, markets, processing, vendors, and evidence behind the release.

Public references

License, security, compliance, device, and release materials are maintained with the project and should be reviewed for the specific release.
